Atlas pilot measurement readout

Date: 2026-08-14
Author: Dana Liu, Data Science
Project: Atlas
Status: pilot results final

The pilot covered 300 first-time workspace administrators across six customer organizations during July. The task boundary and eligibility filters matched the baseline measurement plan. Internal test accounts and duplicate sessions were excluded.

Measure	Baseline	Pilot observation
Median first-workspace setup time	10 minutes	8 minutes
Relative reduction in median time	-	20%
Pilot participants	-	300

The observed reduction is (10 - 8) / 10 = 20%. The original 30% target was not met. The team shipped the guided flow, content and validation changes together; this pilot does not isolate the causal effect of any single change or person. Results apply to this pilot, not all customers, revenue or retention.

Alex Chen implemented the telemetry and validated the task-completion data used in this readout. Priya Shah led the project; Mateo Ruiz implemented the guided UI. The measured product result is a team outcome.

Next measurement action: repeat the analysis after a broader rollout. No broader-rollout result is available in this document.
